DS34C87T
CMOS Quad TRI-STATE Differential Line Driver

General Description

The DS34C87T is a quad differential line driver designed for digital data transmission over balanced lines. The DS34C87T meets all the requirements of EIA standard RS-422 while retaining the low power characteristics of CMOS. This enables the construction of serial and terminal interfaces while maintaining minimal power consumption.
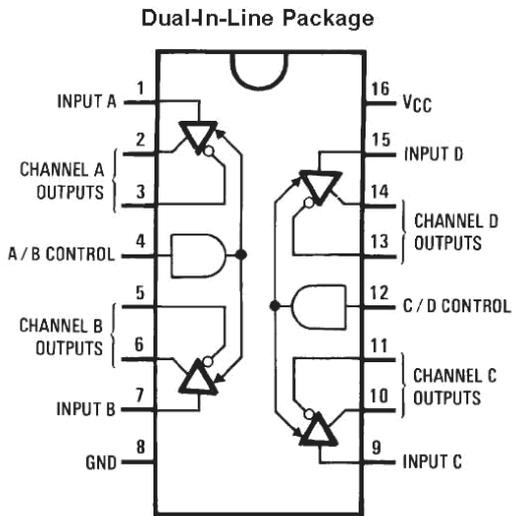

The DS34C87T accepts TTL or CMOS input levels and translates these to RS-422 output levels. This part uses special output circuitry that enables the individual drivers to power down without loading down the bus. This device has separate enable circuitry for each pair of the four drivers. The DS34C87T is pin compatible to the DS3487T.

All inputs are protected against damage due to electrostatic discharge by diodes to Vcc and ground.
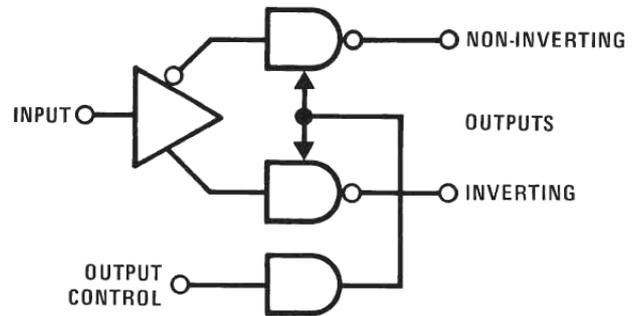

Features

.TTL inputs compatible
.Typical propagation delays:6ns
.Typical output skew: 0.5ns
.Outputs won't load line when Vcc =0V
.Meets the requirements of EIA standard RS-422
.Operation from single 5V supply
.TRI-STATE outputs for connection to system buses
.Low quiescent current
.Available in surface mount

Note 1: Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. They are not mean to imply that the device should be operated at these limits. The table of "Electrical Characteristics" provide conditions for actual device operation.

Note 2: Unless otherwise specified, all voltages are referenced to ground. All current into device pins are positive; all currents out of device pins are negative.

Note 3: Ratings apply to ambient temperature at 25 . Above this temperature derate N package 13.89 mW/ , and M package 9.80mW/ .

Note 4:Unless otherwise specified, min/max limits apply across the -40 to 85 temperature range. All typicals are given for Vcc =5V and T_A =25 .

Note 5: See EIA Specification RS-422 for exact test conditions.

Note 6: Measured per input. All other inputs at Vcc or GND.

Note 7: This is the current sourced when a high output is shorted to ground. Only one output at a time should be shorted.

Switching Characteristics (Note 4)

Vcc =5V± 10%, t_r, t_f ≤6ns (Figures 1,2,3,4)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
t_{PLH}, t_{PHL}	Propagation Delay Input to Output	S1 Open		6	11	ns
Skew	(Note 8)	S1 Open		0.5	3	ns
t_{TLH}, t_{THL}	Differential Output Rise And Fall Times	S1 Open		6	10	ns
t_{PZH}	Output Enable Time	S1 Closed		12	25	Ns
t_{PZL}	Output Enable Time	S1 Closed		13	26	Ns
t_{PHZ}	Output Disable Time (Note 9)	S1 Closed		4	8	Ns
t_{PLZ}	Output Disable Time (Note 9)	S1 Closed		6	12	Ns
C_{PD}	Power Dissipation Capacitance (Note 10)			100		pF
C_{IN}	Input Capacitance			6		pF

Note 8: Skew is defined as the difference in propagation delays between complementary outputs at the 50% point.

Note 9: Output disable time is the delay from the control input being switched to the Output transistors turning off. The actual disable times are less than indicated due to the delay added by the RC time constant of the load.

Note 10: C_{PD} determines the no load dynamic power consumption, $P_D = C_{PD} V^2CC f + Icc vcc$, and the no load dynamic current consumption, $I_S = C_{PD} Vcc f + Icc$

Comparison Table of Switching Characteristics into "LS-Type" Load (Note 11)
