

FEATURES

- Optimized For Off-line And DC TO DC Converters
- Low Start Up Current (<1mA)
- Automatic Feed Forward Compensation
- Pulse-by-pulse Current Limiting
- Enhanced Load Response Characteristics
- Under-voltage Lockout With Hysteresis
- Double Pulse Suppression
- High Current Totem Pole Output
- Internally Trimmed Bandgap Reference
- 500-khz Operation
- Low Ro Error Amp

DESCRIPTION

The UC1842/3/4/5 family of control devices provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include under-voltage lockout featuring start up current less than 1mA, a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current. The output stage, suitable for driving N-channel MOSFETs, is low in the off state. Differences between members of this family are the under-voltage lockout thresholds and maximum duty cycle ranges. The UC1842 and UC1844 have UVLO thresholds of $16V_{ON}$ and $10V_{OFF}$, ideally suited to off-line applications. The corresponding thresholds for the UC1843 and UC1845 are 8.4V and 7.6V. The UC1842 and UC1843 can operate to duty cycles approaching 100%. A range of zero to 50% is obtained by the UC1844 and UC1845 by the addition of an internal toggle flip flop which blanks the output off every other clock cycle.

BLOCK DIAGRAM

Note 1: **A/B**

A = DIL-8 Pin Number. B = SO-14 and CFP-14 Pin Number.

Note 2:

Toggle flip flop used only in 1844 and 1845.

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage (Low Impedance Source)	30V
Supply Voltage ($I_{CC} < 30\text{mA}$)	Self Limiting
Output Current	$\pm 1\text{A}$
Output Energy (Capacitive Load)	$5\mu\text{J}$
Analog Inputs (Pins 2,3)	-0.3V to +6.3V
Error Amp Output Sink Current	10mA
Power Dissipation at $T_A \leq 25^\circ\text{C}$ (DIL -8)	1W
Power Dissipation at $T_A \leq 25^\circ\text{C}$ (SOIC-14)	725mW
Power Dissipation at $T_A \leq 25^\circ\text{C}$ (SOIC-8)	650mW
Storage Temperature Range	-65 to +150
Junction Temperature Range	-55 to +150
Lead Temperature (soldering, 10 seconds)	300

Note 1: All voltage are with respect to Pin 5.

All currents are positive into the specified terminal.

(1) Adjust Vcc above the start threshold before setting at 15V.

(2) These parameters, although guaranteed, are not 100% tested in production.

(3): Temperature stability, sometimes referred to as average temperature coefficient, is described by the equation:

$$Temp\ Stability = \frac{V_{REF}(max) - V_{REF}(min)}{T_J(max) - T_J(min)}$$

$V_{REF}(max)$ and $V_{REF}(min)$ are the maximum and minimum reference voltages measured over the appropriate temperature range.

Note that the extremes in voltage do not necessarily occur at the extremes in temperature.

(4): Output frequency equals oscillator frequency for the UC1842 and UC1843.

Output frequency is one half oscillator frequency for the UC1844 and UC1845.

(5) These parameters, although specified, are not 100% tested in production.

(6) Parameter measured at trip point of latch with $V_{PIN2}=0$.

(7) Gain defined as

$$A = \frac{\Delta V_{PIN1}}{\Delta V_{PIN3}}, 0 \leq V_{PIN3} \leq 0.8V$$

ERROR AMP CONFIGURATION

Error Amp can Source or Sink up to 0.5mA

UNDER-VOLTAGE LOCKOUT

During under-voltage lock-out, the output driver is activating the power switch with extraneous leakage biased to sink minor amounts of current. Pin 6 should currents.

Be shunted to ground with a bleeder resistor to prevent.

CURRENT SENSE CIRCUIT

Peak Current (I_S) is Determined By The Formula

$$I_{SMAX} = \frac{1.0V}{R_S}$$

A small RC filter may be required to suppress switch transients.

OSCILLATOR SECTION

OUTPUT SATURATION CHARACTERISTICS

ERROR AMPLIFIER OPEN-LOOP FREQUENCY RESPONSE

OPEN-LOOP LABORATORY FIXTURE

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5K potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

SHUTDOWN TECHNIQUES

Shutdown of the UC1842 can be accomplished by two methods; either raise pin 3 above 1V or pull pin 1 below a voltage two diode drops ground. Either method causes the output of the PWM comparator to be high (refer to block diagram). The PWM latch is reset dominant so that output will remain low until the next clock cycle after the shutdown condition at pin 1 and/or 3 is removed. In one example, an externally latched shutdown may be accomplished by adding an SCR which will be reset by cycling Vcc below the lower UVLO threshold. At this point the reference turns off, allowing the SCR to reset.

OFFLINE FLYBACK REGULATOR

Power Supply Specifications

1. Input Voltages
 - a. 5VAC to 130VA (50Hz/60Hz)
2. Line Isolation: 3750V
3. Switching Frequency: 40kHz
4. Efficiency at Full Load 70%
5. Output Voltage:
 - a. +5V, $\pm 5\%$; 1A to 4A load
 - b. +12V, $\pm 3\%$; 0.1A to 0.3A load
Ripple voltage: 100mV P-P Max
 - c. -12V, $\pm 3\%$; 0.1A to 0.3A load
Ripple voltage: 100mV P-P Max

SLOPE COMPENSATION

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%.
